

Tuble, Jaymie Margaret C.

ACT AD 2

Smart Voice-Controlled Home Assistant (NLP)

- **Where I'll place it:**

I will place the device in the living room since it is the central area of the house. From this position, it can easily pick up my voice not only from the living room but also from nearby areas like the kitchen and even parts of the bedroom.

- **Why I want it:**

- I do not want to keep standing up just to turn lights or appliances on and off
- It is very useful when I am busy, especially when cooking or doing something with my hands full
- It makes the house feel more modern, efficient, and easier to manage
- It also adds convenience to everyday routines, especially during night time or when I am tired

- **How I'll use it:**

- I can give voice commands like "turn on the kitchen lights" or "turn off all lights"
- I can ask for reminders, time updates, weather forecasts, or even daily schedules
- I can control multiple appliances at once without needing to manually operate each one
- I can use it daily as part of my routine, especially when entering or leaving the house

- **What it uses:**

This device uses Natural Language Processing (NLP), which allows it to understand normal and natural speech instead of requiring very specific or robotic commands.

ESP32 Smart Energy Monitoring and Auto-Control System

- **Where I'll place it:**

I will install this system in the kitchen and bedroom outlets because these are the areas where most electrical appliances are frequently used, such as cooking devices, chargers, and other electronics.

- **Why I want it:**

- It helps reduce electricity consumption and lower monthly bills
- It prevents accidents caused by appliances being left on for too long
- It promotes energy efficiency and responsible usage of electricity
- It gives me better awareness of how much energy I am actually using

- **How I'll use it:**

- I can monitor the energy usage of each appliance in real time
- The system can automatically turn off devices that are not in use or have been running too long
- I can receive notifications on my phone if an appliance is still on or consuming too much power
- I can remotely control appliances even when I am not at home, which adds another level of convenience and safety

- **What it uses:**

This system uses the ESP32 microcontroller, which collects data from sensors, processes it, and controls the power supply to connected devices.
